

WHY CONTROL WEEDS?

Weeds are a major threat to remnant vegetation and the fauna that rely on locally native plants for survival. Weed invasion is responsible for the loss of many species of plants and animals from areas across Australia, including the Mornington Peninsula. Weeds also impact on waterways, stock, pets, crops, tourism, health (e.g. allergies) and safety (e.g. road visibility), gardens and the landscape of an area.

Note: Removal of weeds that are 'trees' or 'shrubs', within the Shire, may require a Planning Permit. If you intend to remove woody trees or shrubs, ensure that you discuss it with the Shire before removal by calling 1300 850 600. A permit is not required to remove 'noxious' weeds.

SHRUBS

Berry-flower Heath *Erica bicucens*
Flowering time: Spring.
Reproduction: Seeds; Spring – Summer.
Control time: All year.

English Broom *Cytisus scoparius*
Flowering time: Spring.
Reproduction: Seeds; Summer.
Control time: All year.

Briar Rose *Rosa rubiginosa*
Flowering time: Mostly Spring – Summer.
Reproduction: Seeds; Summer – Autumn.
Control time: Summer – Autumn, before fruits mature.

Blackberry *Rubus fruticosus* spp. agg.
Flowering time: Early Summer.
Reproduction: Berries ripen late Summer – early Autumn.
Control time: October – April.

Flax-leaf Broom *Genista latifolia*
Flowering time: Winter – Spring.
Reproduction: Seeds; Summer.
Control time: October – December.

Ragwort *Senecio jacobaea*
Flowering time: October – March, but damaged plants may flower any time.
Reproduction: All year.
Control time: All year.

Boneseed *Chrysanthemoides monilifera*
Flowering time: Winter – Spring.
Reproduction: Seed.
Control time: March – April. **Note:** The W.O.N.S. status applies to both subs: *monilifera* and *rotundata*.

Gorse *Ulex europaeus*
Flowering time: Sporadic all year; predominantly Spring.
Reproduction: Seeds; Predominantly Summer.
Control time: All year.

Sallow Wattle *Acacia longifolia*
Flowering time: Spring.
Reproduction: Seeds; Summer.
Control time: All year.

Thorn Apple species *Datura* spp.
Flowering time: Mostly Summer.
Reproduction: Seed.
Control time: Spring. **Note:** *D. innoxia*, *D. ferox* and *D. stramonium* are all Noxious within PPWP.

Hawthorn *Crataegus monogyna*
Flowering time: Spring – Summer.
Reproduction: Seeds; Autumn – Winter.
Control time: September – April.

Spanish Heath *Erica lusitanica*
Flowering time: Spring – Summer.
Reproduction: Seeds; Winter – Spring.
Control time: All year.

Bracelet Honey-myrtle *Melaleuca armillaris*
Flowering time: Spring.
Reproduction: Seeds; Summer.
Control time: All year.

Ink Weed *Physalis octandra*
Flowering time: All year.
Reproduction: Seeds; All year.
Control time: All year.

Sweet Hakea *Hakea drupacea*
Flowering time: Winter.
Reproduction: Seeds; All year.
Control time: All year.

Cape Broom *Genista monspesulana*
Flowering time: Spring.
Reproduction: Seeds; Summer.
Control time: June – November.

Italian Buckthorn *Rhamnus alaternus*
Flowering time: Late Spring – early Summer.
Reproduction: Seeds; Autumn – Winter.
Control time: All year.

Tree Lucerne *Chamaecytisus palmensis*
Flowering time: Winter – Spring.
Reproduction: Seeds; Summer.
Control time: All year.

Cotoneaster species *Cotoneaster* spp.
Flowering time: Spring.
Reproduction: Seeds; Late Summer – Autumn.
Control time: All year.

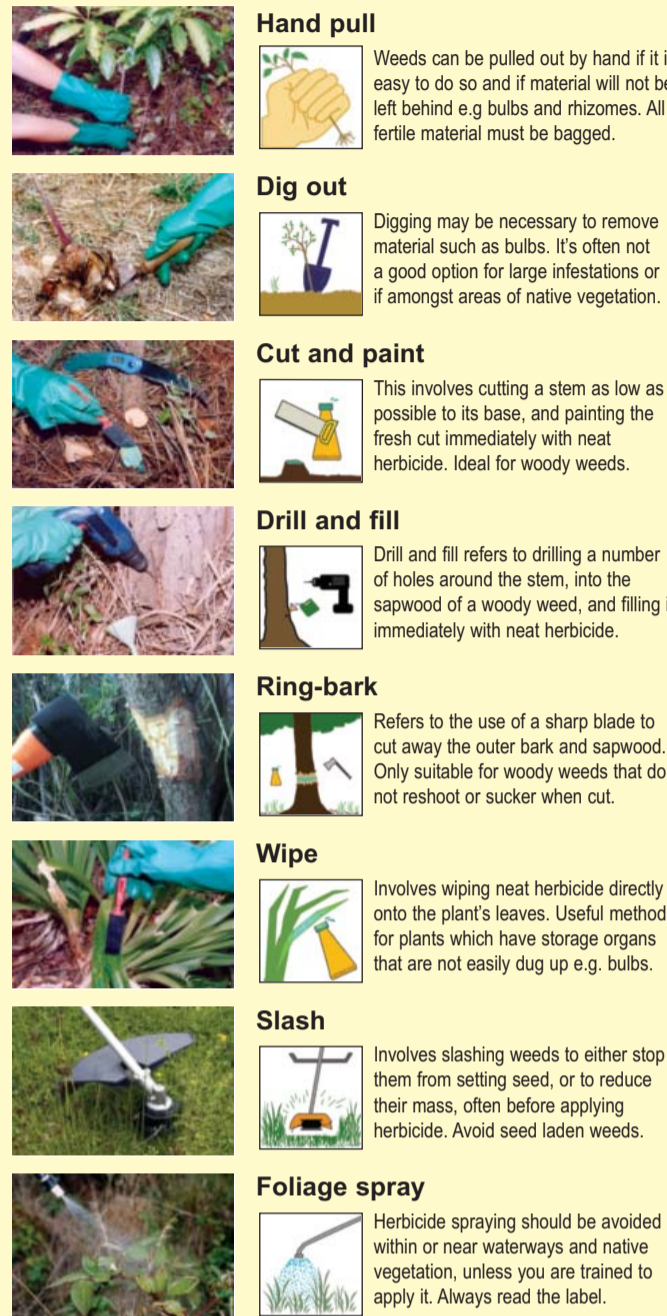

Mirror Bush *Gynostoma repens*
Flowering time: Late Spring – early Summer.
Reproduction: Seeds; Late Summer – early Autumn.
Control time: All year.

Willow Hakea *Hakea salicifolia*
Flowering time: Late Spring.
Reproduction: Seeds; All year with suitable conditions.
Control time: All year.

KEY

DEFINITIONS

Environmental weeds are plants that invade disturbed areas and areas of native vegetation. The CALP Act does not control environmental weeds.

Noxious weeds are plants that are described in Victoria's Catchment and Land Protection Act (1994). This Act defines who should control noxious weeds.

Weeds Of National Significance (W.O.N.S.)
The Commonwealth Government has declared twenty weeds as being nationally significant based on criteria including environmental impact, potential for spread and economic cost.

SOME TIPS ON REDUCING WEEDS IN YOUR AREA

- Correctly identify plants to avoid removing native species. If required seek advice on weed control measures and identification.
- Identify the best control method. Timing is important.
- Minimise disturbance to the soil profile to avoid potential weed spread/erosion.
- Use weed control to help reduce wildlife fuel loads.
- Avoid spreading weed seeds via clothing, equipment and vehicles accessing the site.
- Remove weeds in stages to help minimise any negative impacts on native animals that are using them as refuge.
- Identify which weeds are being utilised by native fauna and provide alternative habitat.
- Revisit control sites before targeting new areas.
- Encourage native plant regeneration when weeding.
- Consider enhancing the attractiveness of your garden to native fauna by selecting suitable local native plants.
- Avoid bringing soil into your property from elsewhere, as it is likely to contain weed seed.
- Avoid purchasing and using soil, mulch and other plant material (e.g. Pea Straw) that may contain weed seed.
- Avoid disposing of aquarium plants and animals on your land or into waterways.
- Consider health and safety precautions when controlling weeds, and always read herbicide labels before use.

Follow up is **essential** for effective control

PLANT PATHOGENS & THEIR IMPACTS

on the Mornington Peninsula

What is a plant pathogen?

A plant pathogen is an agent that can cause disease and death to occur in living plants. They are capable of causing extensive damage to public and private property (including both natural and planted vegetation), and can have significant impacts on industries that rely heavily on good plant health.

Which pathogens occur on the Peninsula?

There are three main pathogens that are of concern here. As each is a fungus, they produce spores which spread quickly via air, wind, water, soil, clothing, vehicles and equipment.

MYRTLE RUST

Uredo rangellii

Identification: Myrtle Rust appears as small raised spots that are brown to grey (often with a red-purple border), developing into masses of distinctive yellow to orange spores up to 14 days after infection.
Distribution: After being found in NSW in April 2010 it quickly spread to South-east Queensland followed by Victoria in late 2011. It is now known at numerous sites in Melbourne and country Victoria, including production and wholesale nurseries.
Affected species: It is only known to affect plants in the Myrtaceae family (including Eucalypts, Melaleucas, Callistemons and Lilly Pillies), hence its name. **Origin:** 5th America.
Spread: As it is a fungus, it produces spores which spread quickly via air, wind, water, soil, clothing, vehicles and equipment.
Control: Eradication is possible on a small scale e.g. home gardens. Large scale eradication is difficult, and consequently the focus is on minimising the spread and impact of this organism. For more information on control visit the following website: www.dpi.vic.gov.au/myrtlerust
If detected: If found, immediately record what you see (e.g. number of infected plants, species affected and location) and contact the national **Exotic Plant Pest Hotline: 1800 084 881. Do not touch, move or collect samples.** Alternatively you can email photos of the material to plant.protection@dpi.vic.gov.au together with your contact details.

CINNAMON FUNGUS

Phytophthora cinnamomi

Identification: Verifying its presence is difficult without microscopic analysis, however there are some common signs. If certain plant species are found to be dead or dying (but not all individuals) in an area of largely healthy vegetation then this fungus may be a suspect.
Distribution: It has been detected on the Peninsula in eucalypt forests and other vegetation, however no formal survey has been conducted locally with regards to distribution.
Affected species: It affects species across many plant families including the Epacridaceae (heaths), Myrtaceae (e.g. eucalypts), Proteaceae (e.g. Banksias and Hakeas), Xanthorrhoeace (grass trees) and Fabaceae (peas), removing their ability to take up water.
Origin: It is believed to be native to South East Asia.
Control: Eradication is very difficult, so as with other fungal pathogens, containment is the key.
If detected: Contact the national **Exotic Plant Pest Hotline - 1800 084 881**

AUSTRALIAN HONEY FUNGUS

Armillaria luteobubalina

Identification: Infected trees develop inverted v-shaped lesions at their base and white rot in the wood, making it stringy. The bark dies and discolours up to 3 m above the ground and clusters of fruiting bodies appear at the base in Autumn (see photo).
Distribution: Also known as Armillaria Root Rot, it can be found in a range of vegetation types throughout Australia. No formal survey has been conducted for this fungus locally.
Affected species: It can affect all species of fruit trees, most native trees, plantations, ornamentals, and some herbaceous plants, and is a major cause of eucalypt deaths and forest dieback.
Origin: As its common name suggests, it is native to Australia.
Control: Eradication is very difficult, so as with other fungal pathogens, containment is the key.
If detected: Contact the national **Exotic Plant Pest Hotline - 1800 084 881**

Pathogens - where can I find out more?

Contact the Department of Primary Industries (DPI) on 136 186 or visit the DPI website: www.dpi.vic.gov.au

GRASSES AND OTHER HERBS

African Love-grass *Enagrostis curvula*
Flowering time: All year.
Reproduction: Seeds; all year.
Control time: All year.

Forget-me not *Myosotis sylvatica*
Flowering time: Spring – Summer.
Reproduction: Seeds; late Spring – Summer.
Control time: All year.
Note: Avoid identity confusion with locally native species.

Paterson's Curse *Echium plantagineum*
Flowering time: Spring – early Summer.
Reproduction: Seeds; Summer.
Control time: September – October.

Agapanthus *Agapanthus praecox* ssp. *orientalis*
Flowering time: Early Summer.
Reproduction: Seeds; late Summer – early Autumn.
Control time: All year.
Note: The same weed species can also have blue flowers.

Gazania *Gazania linearis* (left), *Gazania rigens*
Flowering time: Spring – Summer.
Reproduction: Vegetatively, and by seed.
Control time: All year.

Quaking Grass *Briera maxima*
Flowering time: Winter – Spring.
Reproduction: Seeds; Spring – Summer.
Control time: June – September.

Arum Lily *Zantedeschia aethiopica*
Flowering time: Late Winter – early Spring.
Reproduction: Seeds; late Spring.
Control time: All year.

Kikuyu Grass *Pennisetum clandestinum*
Flowering time: Rarely, except cultivars in Summer.
Reproduction: Spreading stems.
Control time: September – February.

Shade Grassula *Crassula multica*
Flowering time: Spring – Summer.
Reproduction: Seeds; Spring – Summer.
Control time: All year.

Buffalo Grass *Panicum polyanthemum*
Flowering time: December to February.
Reproduction: Primarily vegetatively, but also seeds.
Control time: Autumn and Spring.

Montbretia *Crocus x crocotiflora*
Flowering time: Spring – Summer.
Reproduction: Seeds in Autumn, and corms.
Control time: August – September.

Spear Thistle *Cirsium vulgare*
Flowering time: Winter.
Reproduction: Seeds; Spring.
Control time: April – December.

Bulbil Watsonia *Watsonia meriana* var. *bulbilifera*
Flowering time: After 3rd year; Spring – Summer.
Reproduction: Stem bulbils and underground corms; Summer – early Autumn.
Control time: May – October.

Pampas Grass species *Cortaderia* spp.
Flowering time: Summer – Autumn.
Reproduction: Seeds; Winter – Spring.
Control time: All year.
Note: *Cortaderia selloana* is a serious saltmarsh weed.

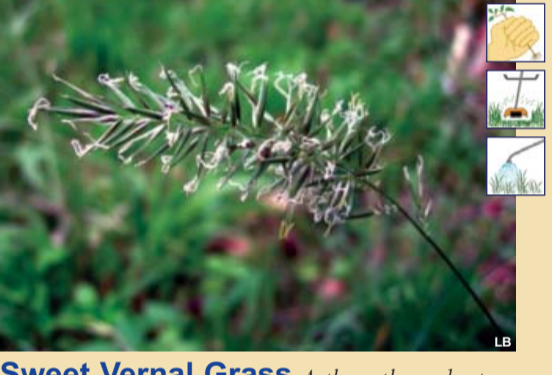

St John's Wort *Hypericum perforatum*
Flowering time: Summer.
Reproduction: Seeds; Autumn – Spring.
Control time: September – November.

Freesia hybrid *Freesia alba* x *Freesia leichlinii*
Flowering time: Spring.
Reproduction: Corms and bulbils; Seeds in Spring.
Control time: Autumn – Winter.

Panic Veldt Grass *Echinochloa crusgalli*
Flowering time: All year.
Reproduction: Seeds; all year.
Control time: All year.

Sweet Vernal Grass *Anthoxanthum odoratum*
Flowering time: All year.
Reproduction: Seeds; all year.
Control time: Winter – Spring.

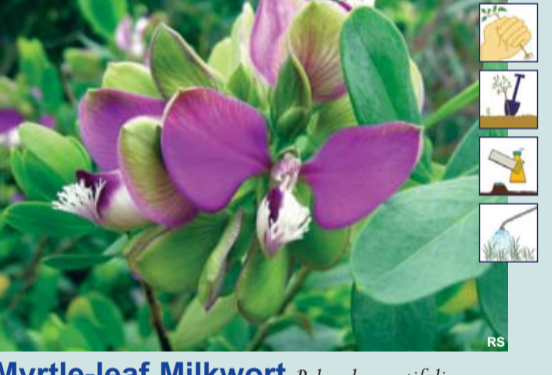

A selection of serious COASTAL ZONE WEEDS present on the Peninsula

African Thistle *Barbarea rigida*
Flowering time: All year, but mostly Spring – Summer.
Reproduction: Seeds and rhizomes.
Control time: All year.

Boxthorn *Lycium fraxinatum*
Flowering time: 2nd year of growth; usually Summer.
Reproduction: Seeds; all year.
Control time: All year.

Myrtle-leaf Milkwort *Polygala myrsinifolia*
Flowering time: All year, but mostly Winter – Spring.
Reproduction: Seeds; Summer.
Control time: All year.

Angled Pigface *Carpobrotus aequilatus*
Flowering time: Spring – Summer.
Reproduction: Seeds.
Control time: Autumn. Note: Hybrids of this weed can also be found. Care must be taken with identification.

Hottentot Fig *Carpobrotus edulis*
Flowering time: Most of the year.
Reproduction: Seeds.
Control time: All year. Note: Hybrids of this weed can also be found. Care must be taken with identification.

Sea Spurge *Euphorbia paralias*
Flowering time: Spring – Autumn.
Reproduction: Seeds.
Control time: All year.
Note: Its sap is an irritant.

TREES

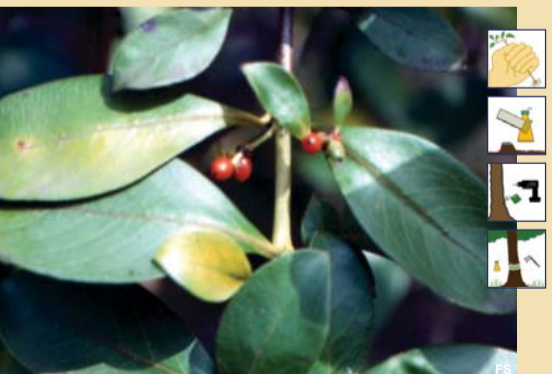

Cape Wattle *Paraserianthes lophantha*
Flowering time: Winter.
Reproduction: Seeds; Summer.
Control time: All year.

Early Black Wattle *Acacia decurrens*
Flowering time: Late Winter – early Spring.
Reproduction: Seeds; Summer.
Control time: All year. Note: Extra care must be taken with identification due to similarities with other Wattle species.

Cedar Wattle *Acacia elata*
Flowering time: Spring – Summer.
Reproduction: Seeds; Autumn – early Winter.
Control time: All year.

Karamu *Coprosma robusta*
Flowering time: Spring – Summer.
Reproduction: Seeds; Summer – Winter.
Control time: All year.

Cherry Plum *Prunus cerasifera*
Flowering time: Summer.
Reproduction: Seeds within red, yellow or purple fruit; Summer.
Control time: September – April.

Monterey Pine *Pinus radiata*
Flowering time: Not applicable.
Reproduction: Seeds; All year.
Control time: All year.

Cluster Pine *Pinus pinaster*
Flowering time: Not applicable.
Reproduction: Seeds; All year.
Control time: All year.

Sweet Pittosporum *Pittosporum undulatum*
Flowering time: Early Spring.
Reproduction: Seeds; Autumn – Winter.
Control time: All year.
Note: As this is a Victorian native, removal requires a permit.

Cootamundra Wattle *Acacia baileyana*
Flowering time: Winter.
Reproduction: Seeds; Spring – Summer.
Control time: All year.

Tree of Heaven *Ailanthus altissima*
Flowering time: Spring.
Reproduction: Seeds; Summer.
Control time: September – April.

Desert Ash *Fraxinus angustifolia* subsp. *angustifolia*
Flowering time: late Winter, early Spring.
Reproduction: Seeds; Summer.
Control time: September – April.

Willow species *Salix* spp.
Flowering time: Spring.
Reproduction: Seeds; Summer.
Control time: September – April.
Note: Only some Salix species are Noxious and/or W.O.N.S.

A selection of serious AQUATIC ZONE WEEDS present on the Peninsula

Alligator Weed *Alternanthera philoxeroides*
Flowering time: November to January.
Reproduction: Vegetative only.
Control time: All year (outbreaks must be reported).

Creeping Buttercup *Ranunculus repens*
Flowering time: Spring – Summer.
Reproduction: Seeds; late Summer.
Control time: All year.
Note: Not confined to aquatic areas. Produces an irritant.

Spiny Rush *Juncus acutus*
Flowering time: All year, but mostly Spring – Summer.
Reproduction: Vegetative, and seed; late Spring – Summer.
Control time: All year.

Salvinia *Salvinia molesta*
Flowering time: Not applicable.
Reproduction: Vegetative only.
Control time: All year (outbreaks must be reported).
